

Theng Ten

For this assignment design we decided to have a store manager to manage the store's system. This is where the store takes in customers, movies, and customer actions. Each movie will have a specific genre and stock stored in the system to keep track of the inventory. Each customer will also have a specific ID. For each borrowed action or return action for the customers, the number of stock will increase or decrease depending on the number of orders and the type of operation. Each movie will have its information stored so the system manager can easily acquire its information or modify it. Most of the information will be stored inside a hashtable so it can be easily accessed.

Main: Run the manager.

```
classDiagram
    class Main {
        -storeManager: StoreManager
    }
    class StoreManager {
        -collectionCustomers
        -collectionMovies
        +buildCustomers(): void
        +buildMovies(): void
        +processCommands(): void
    }
    class Movie {
        <<abstract>>
        -director: string
        -title: string
        -year: int
        +setDirector(): void
        +setTitle(): void
        +setYear(): void
        +getDirector(): string
        +getTitle(): string
        +getYear(): string
        +getMovieType(): char
        +getMediaType(): string
        +ostream<<(): ostream
        +print(): void
    }
    class Media {
        <<abstract>>
        -stock: int
        +setStock(): void
        +getStock(): int
        +addStock(): void
        +reduceStock(): void
